In this work, latest contributions of the actual scientific debate on theme of resilience have been collected. They have been reached and developed in the research project IERDISAF 2016 Resilience, adaptability and transformability. Development, evaluation and implementation of public politics for the adaptive government of complexity. Starting from the consideration that resilience is connected to specific backgrounds and asks for specific approaches, although resilient systems generally present a range of common characteristics, a multi-disciplinary perspective and on more levels (State, society, community, individual) has been decided to be adopted. This also shines through different nature of parts in which the work is divided. All Authors have the merit to have recreated with completeness characteristics of the examined phenomenon, both through an activity of specific and accurate interpretation, and through an introductory or of general character analysis.
